

Assignment for Next Monday 13 Oct

Task: Use vulnerability scanning tools such as **Greenbone/OpenVAS** (or similar platforms) to perform a full vulnerability scan on your lab environment.

Deliverables:

1. Technical Report

- Document the scanning process (tools used, configurations, targets).
- Summarize findings with CVSS scores and severity bands.
- Include analysis of false positives and remediation steps.
- Provide business-context prioritization (e.g., financial vs. sandbox environments).

2. Technical Presentation

- Prepare slides that explain:
 - The scanning methodology.
 - Key vulnerabilities discovered.
 - Severity analysis and prioritization.
 - Remediation recommendations.
- Include technical discussion points for class debate (e.g., credentialed vs. uncredentialed scans, scanner limitations).

Format:

1. Report: 4–6 pages, professional style.
2. Presentation: 10–12 slides, clear visuals, technical depth.

Goal: Demonstrate your ability to use automated vulnerability scanning tools, interpret results critically, and communicate findings in both written and oral technical formats.
